

## BACKGROUND OF THE INVENTION.

To search for singles by using the GPS ( global positioning satellite ) in any

Mobile device with internet connections ,so when you send a request to the

Server it will search in the area if their are any singles that match your request.

## SUMMARY OF THE INVENTION.

According to the present invention the software in the mobile devices with GPS (global positioning satellite) and internet connections is a better way to Search for singles in the area instead of a zip code or city, because it is more Accurate, once you send a request to the server ,the server will search all the Files of each member to verify if they are in your area .this way your request will Be return with data of singles near you.

## DETAILED DESCRIPTION

The software is a search engine for singles with an extra data that is the

Actual position of the members , the actual position is done with a GPS

Global positioning satellite , all this data is file in the server.

The member has a mobile device with GPS and internet connection so

The data can be actualize to the server files.

When a member sends a request ,the data contains his actual position

, radius in (yards or miles) and gap age he/she selected ,this way the server will

Search in his files if any singles in the area selected matches his requests.

Once the search is done the return of the request is done with the singles that

Match his requests,if their are not singles you can request again with a different

Radius ,to enlarge the area .

This software is more accurate for searching singles near your actual position,

Than using a zip code or city where members live but maybe not be their at the

Time you sent your request to the server to search for singles.
